School Grade

Students are often given the grades A, B, C, D, or F to denote the quality of their work. Suppose the public schools themselves, in your community, were graded in the same way. What grade would you give your community's public schools —A, B, C, D, or F?

Basic Methodological Information

Mode:	Live Interviewer RDD Telephone Interviews (Dual Frame: Cell Phone and Landlines)
Population & Sample Area	Alamance County, NC Residents
Dates in the field:	February 21-23, 2014
Sample Size	744
Margin of Error	±3.58
Confidence Level	95%
Weighting Variables	Age , Race, Gender, & Phone Ownership

The Elon University Poll uses a stratified random sample of households with telephones and wireless (cell) telephone numbers. Please direct questions about the Elon University Poll's methodology to the Director of the Elon University Poll, Dr. Kenneth Fernandez at 336-278-6438 or kfernandez@elon.edu.

Procedures Used for Conducting the Poll

The Elon University Poll uses CATI system software (Computer Assisted Telephone Interviewing) for the administration of surveys. We attempt to reach each working telephone number in the sample up to five times. We only interview residents of North Carolina who are over 18. The Elon University Poll conducted the survey over a four-day period. Live interviewers called from 3 p.m. to 8 p.m. Friday (2/21); 11 a.m. to 8 p.m. on Saturday (2/22); 11am to 3 p.m. on Sunday (2/23).

Additional Methodological Decisions

Branching Questions

For many questions with multiple response options, we program our surveys to branch into a secondary probing question.

"Don't Know" & "Refused" Response Options

All questions include an option for respondents to volunteer "don't know" or to refuse. In the vast majority of questions, interviewers do not prompt "don't know" responses.

Weighting

We typically weight results from the Elon University Poll on multiple demographic characteristics: race, gender, household size, region, education, and age. Weighting rarely leads to substantial changes in results. We use iterative raking, adjusting one dimension at a time. We include detailed information about weighting of survey samples for each poll on both the Elon University Poll website and within released reports.

Within Household Randomization

For landlines, we use the common "oldest-youngest" technique to ensure within household randomization. We assume cellphones belong to an individual rather than a household. Thus, we do not conduct within-household randomization within our cellphone sample.

Completion Criteria

An interview is a complete only if a respondent progresses through the entire survey. Respondents who hang up before completing the last question or who refuse to more than 10 % of the questions are incompletes.

Support for Transparency

The Elon University Poll supports transparency in survey research and is a supporter of the American Association for Public Opinion Research Transparency Initiative, which is a program promoting openness and transparency about survey research methods and operations among survey research professionals and the industry. All information about the Elon University Poll that we released to the public conforms to reporting conventions recommended by the American Association for Public Opinion Research and the National Council on Public Polls.

Question Construction and Question Order

In releasing survey results, the Elon University Poll provides the questions as worded and the order in which respondents receive these questions. In some cases question ordering rotates to avoid biases. In an effort to provide neutral, non-biased questions, we attempt to observe conventional question wording and question order protocols in all of our polls. In order to avoid recency or primacy effects, we randomize candidate names and directional response options (e.g. support / oppose) within the text of each question. We pretest every questionnaire multiple times before entering the field.

Sampling

Survey Sampling International, LLC, provide samples of telephone numbers. To equalize the probability of telephone selection, sample telephone numbers are systematically stratified according to subpopulation strata (e.g., a zip code, a county, etc.), which yields a sample from telephone exchanges in proportion to each exchange's share of telephone households in the population of interest. Estimates of telephone households in the population of interest are generally obtained from several databases. Samples of household telephone numbers are distributed across all eligible blocks of numbers in proportion to the density of listed households assigned in the population of interest according to a specified subpopulation stratum. Upon determining the projected (or preferred) sample size, a sampling interval is calculated by summing the number of listed residential numbers in each eligible block within the population of interest and dividing that sum by the number of sampling points assigned to the population. From a random start between zero and the sampling interval, blocks are selected systematically in proportion to the density of listed household "working blocks."

A block (also known as a bank) is a set of contiguous numbers identified by the first two digits of the last four digits of a telephone number. A working block contains three or more working telephone numbers. Exchanges are assigned to a population on the basis of all eligible blocks in proportion to the density of working telephone households. Once each population's proportion of telephone households is determined, then a sampling interval, based on that proportion, is calculated and specific exchanges and numbers are randomly selected.

The wireless component of the study sample starts with determining which area code-exchange combinations in North Carolina are included in the wireless or shared Telcordia types. Similar to the process for selecting household telephone numbers, wireless numbers involve a multi-step process in which blocks of numbers are determined for each area code-exchange combination in the Telcordia types. From a random start within the first sampling interval, a systematic nth selection of each block of numbers is performed and a two-digit random number between 00 and 99 is appended to each selected nth block stem. The intent is to provide a stratification that will yield a sample that is representative both geographically and by large and small carrier. From these, a random sample is generated.

Because exchanges and numbers are randomly selected, unlisted as well as listed numbers are included in the sample. Thus, the sample of numbers generated for the population of interest constitutes a random sample of telephone households and wireless numbers of the population.

Frequently Asked Questions about our Methodology

1. *Who pays for the Elon University Poll?*
Elon University fully funds the Elon University Poll.
2. *Does the Elon University Poll favor a certain party?*
The Elon University Poll is an academic, non-partisan survey. We do not engage or work with any political candidates or parties. We employ best practices to ensure the results are not biased.
3. *Where do you get your numbers?*
We obtain samples of randomized phone numbers from Survey Sample International.
4. *How many times do you call a number before giving up?*
We will attempt to call each working number up to five times before removing it from the sample.
5. *Do you call both cell phones and land lines?*
Yes. We use a mixed sample of both cell phones and landlines. We weight on phone ownership to adjust for the higher probability of selection of those who own both cell phones and landline phones.
6. *Does the Elon University Poll do IVR surveys or automated “robopolls”?*
No. Well-trained students at Elon University conduct all our interviews.
7. *Do you report non-response rates?*
Yes. We report non-response rates based on AAPOR guidelines. The response rate for the Feb. 2014 Alamance County Poll was **9.3%**. The response rate is

calculated using the American Association of Public Opinion Research (AAPOR) formula RR4.

8. *Do you weight the data?*

Yes. We apply weights to the data. An iterative proportional fitting algorithm generates weights based on Census and CDC population parameters of residents in North Carolina. Registered voter screens sometimes cause final weighted variables to not match those parameters exactly- which is intended.

9. *Do you randomize response options?*

Yes. We rotate the order of candidate names in all applicable questions. We also rotate order of text for other questions, such as those that include response options such as “more” and “less.” Furthermore, we rotate the order of some questions themselves if we suspect the order of a question could bias results.

10. *Do you conduct within-household randomization?*

Yes. For landlines, we use the common “oldest-youngest” rotation to ensure within household randomization. We assume cellphones belong to an individual rather than a household. Thus, we do not conduct within-household randomization within our cellphone sample.

The Elon University Poll Team

- **Dr. Kenneth Fernandez** is the Director of the Elon University Poll. Dr. Fernandez holds a Ph.D. in Political Science from University of California – Riverside. Dr. Fernandez is Assistant Professor of Political Science at Elon University. He has published numerous articles in peer-reviewed social science journals.
- **Dr. Jason Husser** is the Assistant director. Dr. Husser holds a Ph.D. in Political Science from Vanderbilt University. Dr. Husser is also Assistant Professor of Political Science at Elon University. He was previously the Associate Coordinator of the Vanderbilt University Poll.
- John Robinson serves as Director of Communications for the Poll. He is a former newspaper editor, veteran journalist, and North Carolina native.
- Daniel Anderson is Vice President of Elon University Communications.
- Eric Townsend is Director of the Elon University News Bureau. Both work very closely with the directors in communicating results of the poll.

Fernandez

Husser

Robinson

Faculty members in the Department of Political Science, chaired by Dr. Sharon Spray, are also involved in advising the directors.

The poll operates under the auspices of the College of Arts and Sciences at Elon University, led by Dean Alison Morrison-Shetlar.

The Elon University administration, led by Dr. Leo Lambert, president of the university, fully supports the Elon University Poll as part of its service commitment to state, regional, and national constituents. Elon University fully funds the Elon University Poll. Because of this generous support, the Elon University poll does not engage in any contract work. This permits the Elon University Poll to operate as a neutral, non-biased, non-partisan resource.

Elon University students administer the survey as part of the University's commitment to civic engagement and experiential learning where "students learn through doing." Student interviewers receive extensive training prior to engaging in interviewing. A team of student supervisors (led by Mary Young '15) assists the directors with quality control and monitoring.
